

Mathematical Pretense of Ordinal Relation to Stated Method

Paris (r.) Matthew Samuel Miles-Brenden

a.) To one considered end; a non-stateful game of intention to focal relation is a participation in any; to the just way of yet then identifiers of disclosure; then and therefore; of which a priorly held understanding to conceptual layer is the provision of comprehension to which an acrimonious intention is known; and plausibly declarative to an end of all commissions understated to an ending.

1.) A pattern; should be recognized as the unconditional terminal openly held ended provisional adjusted and conclusive knowable and provided making of what is a word for then in that of what is with each complete and reacquirable pretense to a stylization and re-equibility of difference and quotient of then it's remainder; the differed contrast of what is a made and a formed conceptual contextual and worded expression of it's shape and contrasted simplified design or descriptive prowess to each; the 'both' to alone what is a simplistic symbolic mathematical conclusively held and withdrawn choice at that of it's description.

2.) Then; of what is a given to that of an enqueued choice of two; the set to one apart of what are a held notion and an expression in linguistic sense; the total choices of descriptive prowess possess a given name; and the solid and known structural relation renewably depart to yet a choice for then that of the given of a clarifier and imparted as a stated reclaimence at what in each is their choice to furtherance in that of coded relation; then to what in each and one given honest impression leaves that of a path in return for any two enqueued bit or byte or nibble structure; for then in alone what are three a one is apart.
