

# Intentions and Definitive Purpose of New Device:

There are only two given capacities of the new device of importance to proclaim at this juncture; but they are declarative of it's meaning as well as its scrutability of it's measure; and the importance of it's boundless range.

1.) While it is possible to connect a measure of 18 (8+10) laser diodes to reference measures at a more round simplistic layer; it is also possible to pass a single individual laser diode of reference measure as one i/o as two references for that of light and quantifiable energy proportion and balance of light to time ratio; of proportion.

2.) While it is possible to connect a measure of 2 (i+o) laser diode references in measure at a less sophisticated embedding; it is not possible to route these measures for greater extensibility of device properties; yet; it is in & this superior in the sense of conservativeness; and with reference of channel extensible in fullness of simplicity.

**Note:** This difference is due to two notable differences; that of the spread (or distribution) of light and field in their spectral line ordering in reference to that of combination under singular combining of light; or it's given monochromaticity; or that of reference to the given of light field as a spread distribution; yet so as color is a given only seen as one for a given combination; it is true that there can be less loss through a conservative process; hence even though a 'double-winding' would be proper to augment light; that of the less demanding (and on power for a specific reason of allocation); although of lesser capacity; creates from out of motion that of the nature of difference of recombination (singular capacitated difference of means) of sound and that of light.

Hence; for the decision that is (re)-combination of a given light field; the disconnection under current circuit topology is only instructive as a given and workable under pretence of given solution of method when and only if 2 is as a given the relation of proper admixture; and this produces seamlessness of input output relation; a demand that otherwise may not be met otherwise with no such means unless extensibility is foreshortened and known to produce that of one tertiary element; hence that of one such input output is sophisticated enough too.
