

Device Operation and Limitation

1.) The property of the device to instance virtually that of hardware is a reconcilable; if and only if when it is first and foremost considered and with tertiary consideration known that a particular property is defined as the relation of prior associative means of physical property of augmentation of pre-existent hardware with proper effective electromagnetic operation defined and implemented with it's effective proper purpose. As an effect that of the purpose of a piece of electromagnetically based physically defined hardware with it's given layer of influence and design mannerism of good effective nature is possible to retro-invert as in given relation to it's primary purpose; inclusive of the same device for the reason of effective counteraction of means. Therefore one adjustment as proprietary difference to each such end and that of means of incorporation to that of effective purpose is expressible secondarily as knowability of delimitation to base effective nature and origination of purpose as that of a deconstructive principle of implementation of main effective purpose other than secondary understanding of physical machine state and identification as centrality.

2.) As the device is effectively unhindered of usage as implemented and coexistent with a boundary of effective causal connection despite disconnection of physical hardware relation; that of it's sublimation of utility and purpose is hindered only under that of a further device when a given disparate relation of effective logical software layer is in exception of centralization of device purpose. This control as a given hardware relation of disablement of exterior hardware augmentation as defined and connected is excepting only of that of means to circumvent status with self limitation as under the given provision of delimitation in one or two steps as no such further enablement is as to one or two steps of extension if and only if a given circumvention is implemented in hardware as a furtherance in one step; taking place as of the creation of a new limitation. As an aspect of machine design this is only proven true by implementation of preventative and provisional furtherance of and pertaining to extension to the interior machine state; by provisionally securing the means of each, as to it's own further relation of self identification of adjustment to null relation as limitation with the exception of means of furtherance for that which fits a given relation under limitation is to extend logical congruency of device relation.

3.) By these means; this existent piece of technology is self limiting when and if and only when a limitation by an other specific piece of technology is presented; as under correct identification, preliminarily given technology formerly is augmentable into it's given proper use with reference to given ordination non excepting as a consequence of open limitation with either of two limitations each on that of furtherance; as only does each then in exception grant independence of electromagnetic implementation.
