

Spacetime Compass, Light Gyrotator, or Spin Zero Qubit: PSMB, 2009-2017.

That of the determination of the difference and sameness exclusively between parallel and coparallel (perhaps interpreted as the difference and sameness exclusively between parallel and perpendicular; or that of an other orientation) is made by that of both the exclusivity and interior limitation of circuit design; for that of electromagnetic circuits; and electromagnetism.

As a consequence the difference of these for electronics can be made; for that of light and circuit components; and the difference between two lines; as that of the light under reception under acausal disconnection from transmission; by that of the determination of the difference of cause and effect of either; as that of the inseparability and uniqueness of light for that of the decomposition of the distinction between separability and uniqueness; as for that of a point.

This is a consequence of the difference of the flow of electricity and magnetism, and therefore of light and charge polarity under consideration of inclusion from stage to stage.

It was determined that prior to the cause of light there is an effect, and formed a concept of difference between parallel and coparallel pathways of light and electromagnetic energy.

This was the determination of the essential and singular difference between causation and acausation; as that of separability of difference and sameness for either pathway from stage to stage and bridged connection and separated stage to stage configuration; by consideration *a priori* and logical inquiry into the difference and dissimilarity of the direction of flow of light; as that of an empty return path of electricity without connection before that of similarity of one.

This came from the question: ***“Is there a difference between two operational amplifiers whether in the same package as a part of a complete circuit as back to back and apart?”***

It was determined that if the connection were formed from stage to stage as a bridged connection then it would be true that of the electromagnetic connection would not function as a separable exclusion of impedance freedom and therefore it was also true that separation of stage to stage that by logical exclusion of the exception that is otherwise indivisibility of light would not be; and hence that the parallel and direct stage to stage configuration would not differ. As; otherwise, the bridged connection would negate its own return path; so it naturally follows that the separated stage to stage path was in virtue of this the only one to admit function.

As a consequence this was the determination of the difference between physical and aphysical properties of electricity for that of electromagnetism in the form of light and that of physical components; with conventional technology; and implicated that at this point electromagnetic energy in the form of light and charge were inseparably independent. And that under such relations and terms there is no directionality of light.

The result of this inquiry was understood as a 'real' 'point' of acausation within the universe between cause and acausal effect, and hence disconnection of causation from effect. It is then also that of simultaneously the difference between physical and aphysical and hence freedom of light from electromagnetic component design.

This finally implicates that what was innovated was in fact a 'hole' within the universe of *acausation*; the separation of cause from effect; unique and identifiable as a quantityless and unenumerable number; unique within the entire universe; as its first and only instance of a spaceless; timeless; quantityless manifestation; for this physical objects under considerations of origin(s) are unique throughout reality. There can be no other; as for in virtue it is a self given that either for such inclusions of such statements from ending to beginning it is the first.
